Discussions & Exercises

7.3. Padding and Stride

CNN의 input width/height가 주어졌을 때, output width/height를 구하는 공식은 다음과 같다.

O: output width/height

I: input width/height

K: kernel size(width, height)

P: padding sze

S: stride

$$O = \frac{I - K + 2P}{S} + 1$$

만약 $I - K + 2P$가 S로 나누어 떨어지지 않는다면 어떻게 될까?

```
import torch
from torch import nn
```

```
# CASE 1
input = torch.zeros(3, 5, 5)
conv2d = nn.Conv2d(3, 3, kernel_size=3, stride=3, padding=1)
# O = (5 - 3 + 2) / 3 + 1 = 2.333

output = conv2d(input)
print(output.shape)
```

```
torch.Size([3, 2, 2])
```

```
# CASE 2
input = torch.zeros(3, 7, 7)
conv2d = nn.Conv2d(3, 3, kernel_size=3, stride=4, padding=1)
# O = (7 - 3 + 2) / 4 + 1 = 2.5

output = conv2d(input)
print(output.shape)
```

```
torch.Size([3, 2, 2])
```

나누어 떨어지지 않는다면 소수점을 버리게 된다. 가령 case 1의 경우, 주어진 input의 row(또는 column)에 대해 convolution 연산을 2번 시행한 뒤 남는 칸이 발생하는데, 이것은 건너뛰게 되어 최종적으로 width와 height는 2가 되는 것이다.

```
input = torch.tensor([[1, 1, -999999], [1, 1, -999999], [-999999, -999999, -999999.0]]).reshape(1, 3, 3)
conv2d = nn.Conv2d(1, 1, kernel_size=2, stride=2)
print('weight:', conv2d.weight.data)
print('bias:', conv2d.bias.data)
print('output:', conv2d(input))
print('sum of weight and bias:', conv2d.weight.sum() + conv2d.bias.sum())
```

```
weight: tensor([[[[-0.4835, -0.1470],
          [-0.1025, -0.3671]]]])
bias: tensor([-0.4484])
```

```
output: tensor([[[-1.5484]]], grad_fn=<SqueezeBackward1>)
sum of weight and bias: tensor(-1.5484, grad_fn=<AddBackward0>)
```

주어진 3*3 크기의 input의 좌상단 2*2 부분(모든 값이 1)에 대해서 2*2 size의 kernel로 convolution 연산을 시행하고, 남는 부분(모든 값이 -999999)은 건너뛴다는 것을 확인할 수 있다.

7.5. Pooling

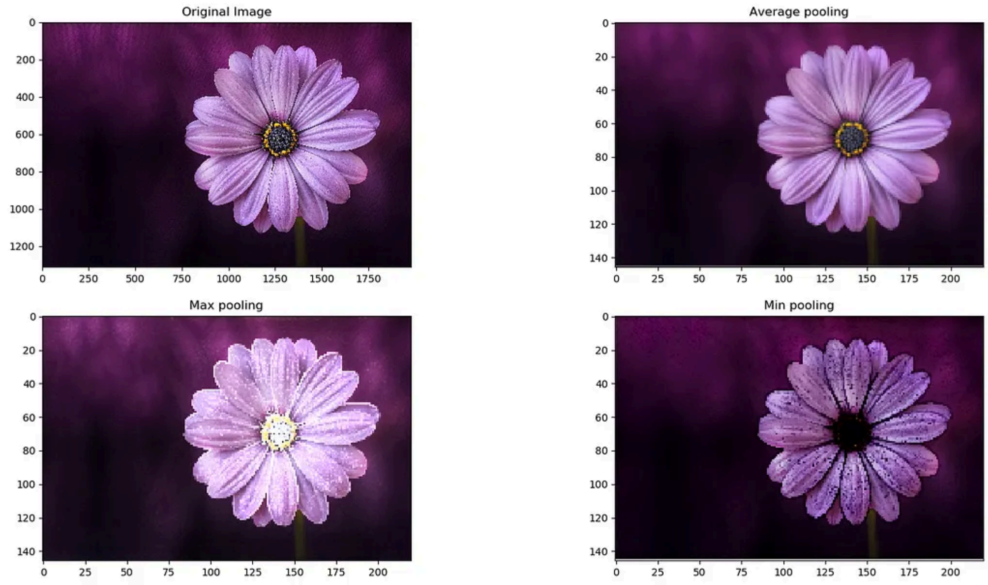
Pooling에는 Max pooling, average pooling, min pooling 등이 있다. 이들의 차이점은 무엇이고, 각각을 어떤 상황에 사용해야 할까?

Max pooling: 주변 영역의 maximum pixel 값이 선택된다.

Min pooling: 주변 영역의 minimum pixel 값이 선택된다.

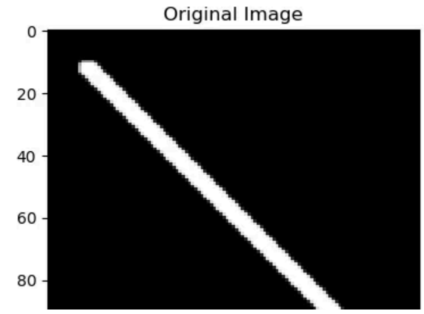
Average pooling: 주변 영역의 pixel 값들의 평균이 선택된다.

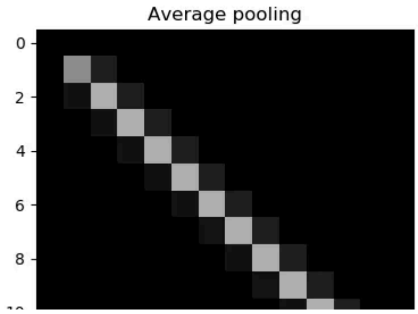
이들의 차이점은 다음 그림을 통해 확인할 수 있다.



Average pooling은 이미지를 smooth하여 sharp features가 사라지게 된다.

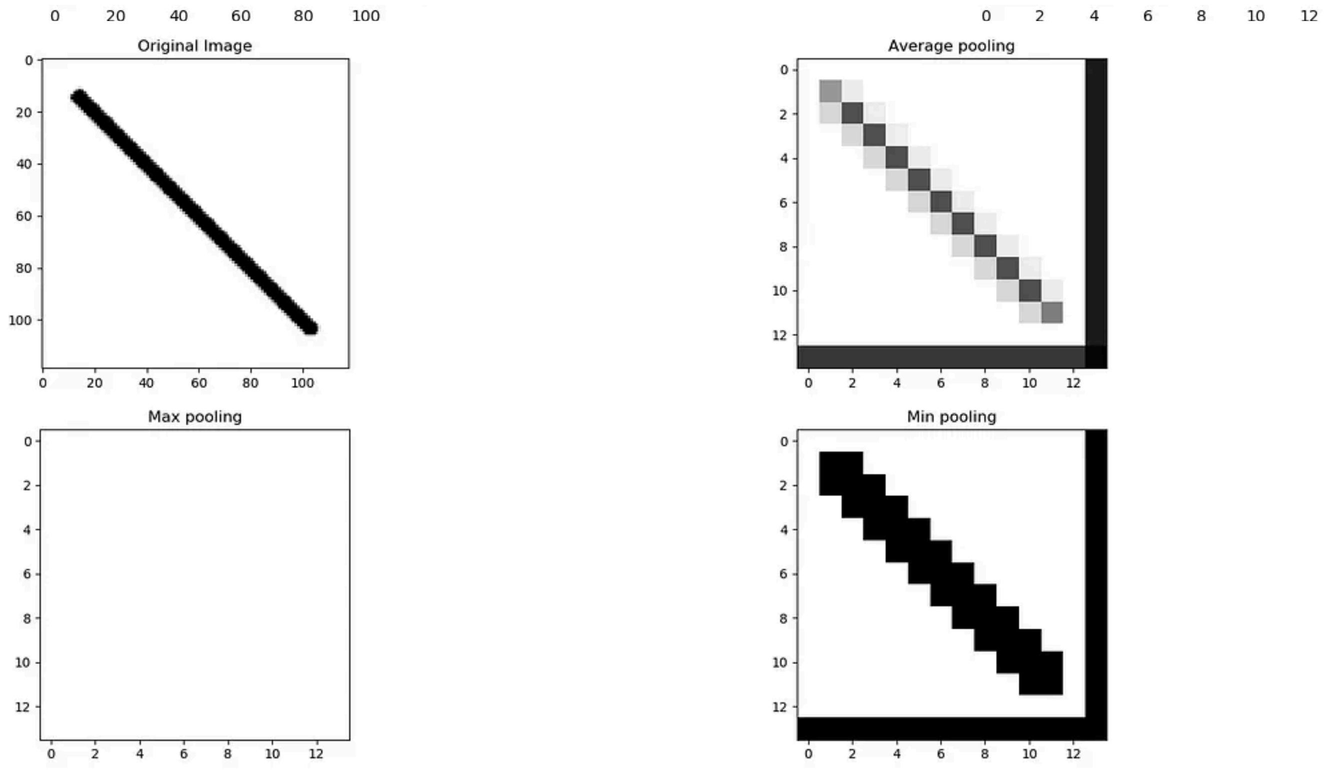
반면 max pooling은 이미지의 밝은 픽셀을 선택하게 된다. 그렇기에 MNIST dataset과 같이, background가 검은색이고 object가 하얀색인 이미지에서 max pooling이 사용될 수 있다.





이를 통해 computational cost를 줄일 수 있다.

반대로 min pooling은 이미지의 어두운 픽셀을 선택하게 되기에, background가 하얀색이고 object가 검은색인 이미지에 대해 사용될 수 있다.



이처럼 각각의 pooling method는 각자 사용되는 용도가 다르다. 일반적으로 max pooling은 이미지에서 중요한 정보를 추출하기 위해 사용되고, average pooling은 feature의 일반적인 정보를 추출할 때 사용된다. CNN에서는 주로 max pooling이 사용되고, average pooling은 주로 마지막 레이어에서 사용된다. Min pooling은 자주 쓰이지 않는다.
